**MORE
THAN
JUST
STEREO**

inDepth Stereo is a 3D Surround Audio Processing which produces a virtual 3D environment by passing through master audio channels to our methods and special technique.

'inDepth Stereo' is sensibly priced, affordable, does not need any specially built sound systems and produces precise sound. Because 'inDepth Stereo' uses our special methodology and technique, specially trained people are used, instead of using hardware systems. The resulting Audio sounds more real and precise according to the direction the sound is desired to be projected relative to the listener.

'inDepth Stereo' is able to convert any Sound Track or Audio Channels for Music, Film, and TV Productions,

even if given in separate tracks or in "already mixed together" Audio format, directly into superior quality 3D Surround Sound.

At the core of our system we put a stereo "panorama slicing" algorithm that creates a much cleaner, clearer, more discrete surround sound experience than any other conversion technology available today. Most importantly, our Surround Masters can be downmixed back to normal Stereo with absolutely no degradation. ●
