TIMS

TELECONSULT INFRASTRUCTURE MANAGEMENT SYSTEM

WHAT IS TIMS?

TIMS (Teleconsult Infrastructure Management System) is a suite of applications developed by experts in the InfoCommunications Technology (ICT) / Telecommunications Industry, to meet the needs of Infrastructure Owners.

TIMs is designed for Owners who are Planning, Developing, Constructing, Operating and Maintaining Telecommunications Networks for Cellular Mobile, Trunk Fibre Optic, FTTx, OPGW, Toll Roads and Expressways, Pipelines – Water, Sewerage, Electrical Distribution, Oil and Gas and Defence applications

TIMs uses Open Source and readily available industry standard Open GIS protocols, thus reducing a lot of issues, regarding licencing and associated costs and therefore negating the need to use prohibitively expensive proprietary Asset and GIS management systems.

TIMs provides access to both existing legacy and proposed new data, using an eloquent and user friendly GUI, so the user can search, query, view and update data from literally anywhere using standard Web Browser, Google Earth, selected Mobile Devices like iPhone, the iPad, from the Office, on the move, or on site in the field.

WEB ACCESS

TIMs is designed to take advantage of the most widely used web protocol standards and file formats currently available.

Teleconsult can customise web access to geographical and alphanumeric data about virtually any data that be fixed by a GPS position without the need to install additional software or manage software licenses.

The web-based GIS interface can be used by end-users with standard web-based application knowledge, reducing the need for personnel to become trained or certified in proprietary software.

MOBILE ACCESS

The TIMs Mobile Access capability enables the user with truly pervasive usage opportunities.

Data can be made available on the move or at site, enabling a paperless solution for the user and Reports, Pictures or Videos can be uploaded into a central server, from a Mobile device, where it can be viewed by other system users.

INTERFACING WITH OTHER REAL TIME MONITORING SYSTEMS

Vehicle and Asset tracking is an optional feature, which is available in near real time.

Interfacing to Telemetry and SCADA systems is also possible
